

Release 1: a focused workshop release

Book the work. Agree the quote. Keep the customer informed. Print and scan the bike tag.

01 Keep booking, diary, job cards, workshop workflow and line-by-line quote approval.

02 Keep real email, SMS and WhatsApp on shop-owned provider accounts.

03 Build one proven Lightspeed connector and physical bike-tag printing.

04 Money, import, reports, groups and disaster-recovery development move to Later.

What stays in Release 1

One complete workshop journey, supported by the shop's existing till.

01 Customer booking, workshop diary, job card, capacity and collection status.

02 Itemised quotes: customers approve or decline individual lines.

03 Email, SMS and WhatsApp updates and the agreed reply routes.

04 One Lightspeed connection, printed job cards and scannable bike tags.

What moves to Later

The expensive financial, migration and group work is removed from this build.

01 Invoices, online payments, deposits, refunds and new till-settlement work.

02 Customer import and historical migration.

03 Report suites, group capacity and the supporting chain model.

04 The second Lightspeed adapter and the disaster-recovery programme.

The store workflow

Wheelhouse manages the repair; Lightspeed remains the place where money is handled.

01 Book in the bike, create the job and print its tag.

02 Inspect, propose work and get approval for the selected quote lines.

03 Schedule, send updates and hand approved work to the linked Lightspeed job.

04 The shop invoices and takes payment in Lightspeed; staff record collection in Wheelhouse.

One Lightspeed: prove access first

R-Series is the planning recommendation. The actual shop and API proof decide.

01 Confirm the first shop's series and a usable test account with app authorisation.

02 Prove product, stock, employee and current-job customer access.

03 Create, update and cancel a test work order; verify part and labour effects.

04 Prove refresh, revocation, child-line updates and safe handling of uncertain results.

The integration boundary

No customer migration or payment engine hidden inside the connector.

01 Lightspeed supplies product identity and stock; Wheelhouse owns scheduling and approval.

02 Link only customers needed for current jobs. Do not backfill customer history.

03 One stock authority: measure what work-order part changes already do.

04 Invoices, payment and refunds stay in Lightspeed. Failed or uncertain handoffs stay visible.

Print the tag. Scan the right job.

A useful physical tag is an early deliverable, not a finishing touch.

01 Print a readable job number, bike identification and a QR for the staff job page.

02 Use a phone or 2D reader for QR; add a barcode if the shop uses a 1D scanner.

03 Confirm printer, label dimensions and driver PC; test the actual tag on a bike.

04 Scan respects staff login and shop access. Offline printing and deliberate reprints are visible.

The new build sequence

Deliver a useful workshop slice before completing the connector and message channels.

01 A — prove API and printer setup; check tenant and staff access.

02 B — persistent job, quote basics, printed tag and scan-to-job.

03 C — capacity, diary, customer booking, line approvals and messaging.

04 D/E — connect the proven Lightspeed workflow, then run the store acceptance scenarios.

First implementation issues

Start with evidence and one job the mechanic can print, scan and work on.

01 Prove Lightspeed account/API access and the supported printer/scanner combination.

02 Close tenant and session-revocation gaps; preserve shop isolation.

03 Persist the job, planned effort and stable job reference without creating a sale.

04 Build tag/scan, quote-line approval and atomic capacity in dependency order.

What proves Release 1 is ready

Show the whole store workflow, including the real connector and physical tags.

01 Guest booking → quote approval
→ workshop work → ready →
collection.

02 Concurrent booking and revised
quotes preserve capacity and the
approved amount.

03 Real channel delivery/replies,
linked Lightspeed job and a
successful tag scan.

04 No invoices, payments, import,
report, group or recovery setup
required to use the release.

Store review: remaining inputs

The scope is narrower. The next choices are concrete account and shop-workflow details.

- 01 Which Lightspeed series does the first shop use, and is the test app/account available?
- 02 Which printer, tag stock, driver PC and scanner will the shop actually use?
- 03 Which email/SMS/WhatsApp providers and inbound reply paths are required?
- 04 Confirm quote revision, book-in/collection and tag-content examples; then assign the issue slices.
